

# Discrete Simulation: Homework 1

Austin J. Maddison

Mahidol University International College

September 20, 2024

## 1. Birthday Problem

The simulations ran were set to  $seed = 27$  and  $N = 100000$ .

a)

$$p_{10} = 0.1169$$
$$CI = [0.1169, 0.1189]$$

b)

$$p_{20} = 0.4113$$
$$CI = [0.4113, 0.4143]$$

c)

$$p_{30} = 0.7059$$
$$CI = [0.7059, 0.7088]$$

d) Found  $n$  that satisfies the condition  $p_n \leq 0.5$  from extracting the smallest difference from varying  $n$ 's of  $p_n$  and the function of  $p = 0.5$ .

Figure 1: Closest point to  $p = 0.5$  was  $p_{23} = 0.54$  which satisfies the condition.

## 2. Alice and Bob Play a Game

The strategy I let Alice have is the following...

### Case 1: Found Exclusive Output

She presses the button recording  $n$  output values  $x_1, x_2, \dots, x_n$ . As she records each output she checks whether  $x_i$  is exclusive to one of the buttons output range. If  $x_i$  is exclusive she returns the corresponding button as the answer.

### Case 2: No Exclusive Output

After she presses the button  $n$  times with no exclusive output appearing. She calculates  $\bar{x}$  and finds the minimum difference between the mean output range of the 2 buttons. She returns the corresponding button that gets the minimum distance.

### Pseudocode

Although the source code differs because loops are removed for speed, the idea is the same.

```
xs = []
for i in range(0, n):
    x_n = button_unknown.get_next_value()
    xs.append(x_n)

# Case 1: Found exclusive output.
if(x_n == 1)
    return 1 # it is button 1
if(x_n == 100)
    return 2 # it is button 2

# Case 2: No exclusive output. Evaluate
the minimum distance of means.
x_mean = sum(xs) / n
button_1_mean = (1 + 99)/2
button_2_mean = (2 + 100)/2

return argmin([abs(x_mean - button_1_mean)
, abs(x_mean - button_2_mean)]) + 1
```

### Find $n$ such that Alice is correct $\leq 0.9$

Similar to problem 1.Birthday Problem, I sampled Alice's strategy over some reasonable range of  $n$

$[0, 500]$  and extract the  $n$  that results in probability  $p$  that Alice is correct is atleast 0.99. I set the seed=27 and ran 1000 trials for each all  $n$ 's.

Figure 2: Closest point to  $p = 0.99$  was  $p_{375} = 0.990$  which satisfies the condition.

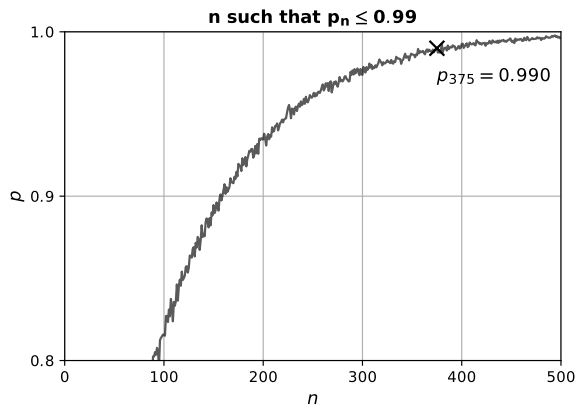

Figure 3: y-lim[0.8, 1.0] of Figure 2.

### 3. Practice with Uniform and Geometric Distributions
